EDUCATION

Georgia Institute of Technology

Atlanta, GA

Bachelor of Science in Computer Science

May 2029

Relevant Coursework: *Data Structures and Algorithms, Object Oriented Programming, Computer Organization*

TECHNICAL SKILLS

Languages: Python, Java, C++, C, C#, CUDA, Go, SQL, TypeScript, JavaScript, HTML/CSS

Frameworks: React, FastAPI, gRPC, Azure Functions, Unity

Cloud & Data: Azure (Blob Storage, Cosmos DB), PostgreSQL, MongoDB, Kafka, Docker, Linux, Git, CI/CD

Libraries: PyTorch, LightGBM, SHAP, CuPy, FAISS, CLIP, ONNX Runtime, NumPy, pandas, xarray, JUnit

EXPERIENCE

Microsoft | *C#, TypeScript, Azure, SQL*

May 2026 – August 2026

Software Engineer Intern, Azure Storage

Redmond, WA

- Cut storage incident triage from hours to minutes by building a diagnostics dashboard (C# APIs, React) that queries 200M+ telemetry events across regional clusters.
- Sped up cross-region log queries 40× (6 min → 9 sec) using partition pruning, pre-aggregated rollups, and asynchronous polling to work around gateway timeouts.
- Restored replication alerts for 3,000+ storage accounts by tracing a silent configuration drift across 4 service layers, from deployment manifests to runtime flags.
- Unblocked the team's capacity planning within 72 hours by benchmarking 3 query strategies on 200M+ production events against a sub-5-second latency target.

Ocean Robotics Lab | *Python, ROS, CUDA, PyTorch, HPC*

August 2026 – Present

Undergraduate Researcher

Atlanta, GA

- Building a GPU-accelerated sonar simulator on Georgia Tech's PACE cluster to make underwater mapping experiments, which take thousands of runs, practical to repeat.
- Porting the lab's CPU ray-tracing code to custom CUDA kernels, with tiled memory processing so 1M-point seafloor meshes fit on NVIDIA A100 GPUs.
- Benchmarking speedup and FP32 vs. FP64 precision against a multi-core CPU baseline on real survey data from the Gulf of Mexico.

PROJECTS

Trailmix | *Python, PyTorch, FastAPI, React, FAISS, CLIP*

May 2026 – Present

- Reduced hiking trail search latency 75% with FAISS vector indexing, enabling sub-100 ms similarity search across 25,000+ trail photos.
- Raised Top-5 precision to 86% (+31% relevance) with a ranking model combining CLIP image embeddings and each hiker's saved trails.

Sprout – HackGT 2026 | *React, Flask, PostgreSQL, LightGBM, Gemini*

September 2026

- Launched a community garden planner with a team of 4, building all 6 React screens and an interactive plot map; grew to 150+ users in the first month.
- Trained a LightGBM model on 12 soil, weather, and planting features to predict which beds need watering, catching 85% of dry days at a 10% false alarm rate.
- Built the Flask backend with SHAP explanations and Gemini plain-language tips, adding output checks that block advice about pesticides.
- Kept the app running through weather API outages with a 2-tier cache fallback, covered by 24 backend tests.

LEADERSHIP

GT Solar Racing Engineering

September 2026 – Present

Software Lead

Atlanta, GA

- Lead software for the team's solar car, building battery telemetry, race strategy tools, and a live dashboard in Python and React for the 2027 American Solar Challenge.
- Built a race simulator that replays past routes and mentor 5 new members on the codebase, code review, and embedded C development.
